Pigment Binder

Pigment Binder is a water-based acrylic fixer suitable for adhering pigments on models and groundwork. We can use it directly on the model's surface and then apply the pigments, helping them adhere to the model. It dries slowly, allowing more time to manipulate the pigments by blending them and mixing several different shades, or to create various effects on the model.

By Chema Cabrero

1 We can use several pigment tones. It is always advisable to use several shades to give variety across the model.

2 Now we can apply the pigment directly to the moistened surface of the kit.

3 We can mix and blend the pigments in a random fashion, using different shades.

4 We can create streaking effects to replicate the effects of rain and condensation.

5 The finished model.
